

The Reinke Lab Update

Michelle Kudron and Mei Han
Dec 10th, 2015

Outline

- **Summary of ChIP-seq progress**
 - Completed datasets
 - Datasets in the pipeline
 - Worm pellets ready for ChIP
 - Factors that failed
 - ChIP'd factors for RNA-seq
 - DCC topics for discussion
- **Update on RNAseq project**
 - Backcrossed deletion mutants
 - Deletion strains waiting for backcross
 - RNA isolated for sequencing
 - RNA isolation in progress and backcrossed strains waiting for RNA isolation

Sequencing data for 136 new datasets

- 33 completed datasets for Bridge year (24 factors that missed the data freeze were sequenced at Stanford)
- 32 completed datasets for year 1
- 64 completed factors for year 2
- 7 completed factors for year 3
- In total, data for 123 new TFs

OP514_SPR-4 has a rearrangement
OP558_LAG-1 is ZTF-16

Pending factors

OP563	CEBP-1	YA	
OP565	ZTF-26	YA	
OP568	LSY-12	L3/L4	
OP570	C33H5.17	L4	
OP579	DPFF-1	YA	
OP556	CEH-89	YA	Failed twice
OP553	CEH-79	YA	

Enrichment of OP565_ZTF-26 following library preparation

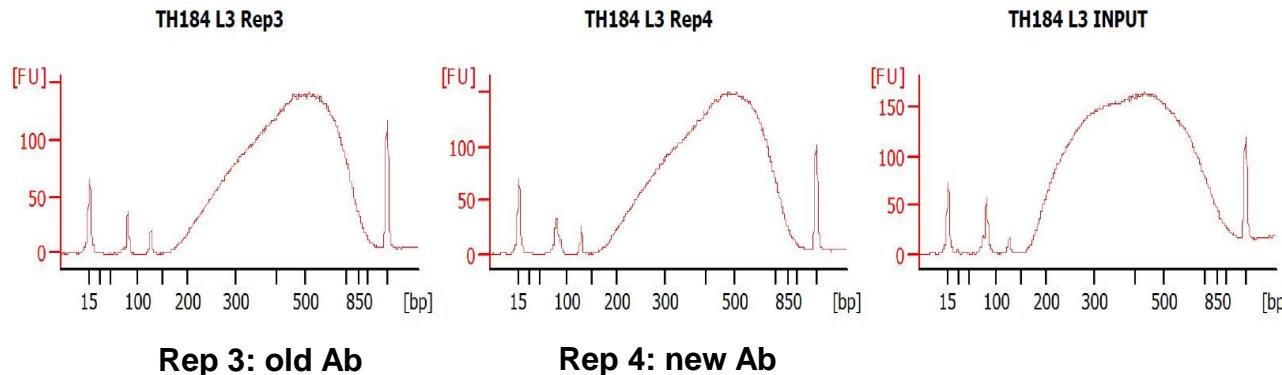

Input samples look good which rules out library issues

OP565_ZTF-26 expresses well

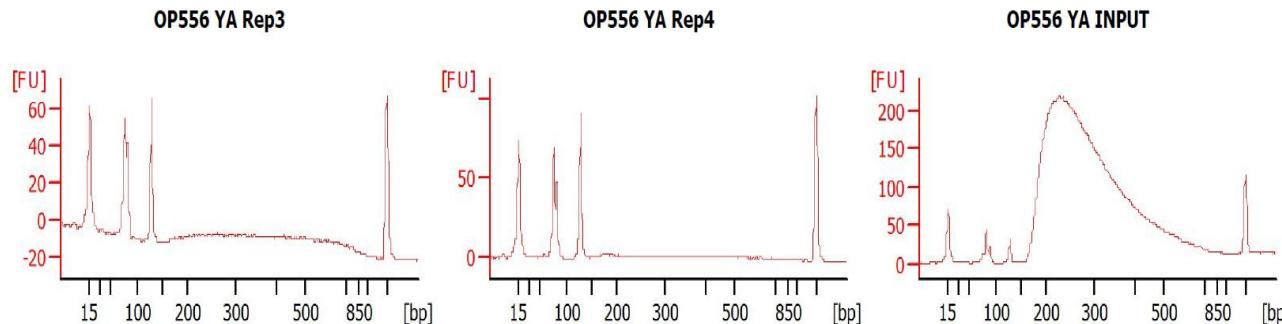

Failures are not due to an antibody issue

Repeated TH184 (HMG-11) that previously worked using old and new Ab aliquot

Conclusion: Our antibody aliquots received in September of 2014 are still working

Repeated OP556 (CEH-89) that failed using new Ab aliquot

Conclusion: OP556 failed again. All ChIP and library reagents are working.
Issue is likely with the worm sample (fixation or sonication). 7

Troubleshooting ChIP issue

- Bought new formaldehyde
- Sonicator not working as well since Aug 2014 (lower protein concentrations). We purchased a new tip in April 2015 but it did not improve protein concentrations significantly. Despite this, there were no ChIP issues until now.
- We will increase the amplitude on the machine from 10 to 12 in order to improve sonication
- We will test new sonication conditions on OP556_CEH-89 frozen worm pellets

Summary of ChIP'd TFs for TF(RNAi/del)/RNA-seq

TFs with completed ChIP-seq data (32)

Deletion strain available (23) RNAi clone available (9)

CEH-30	BLMP-1
FKH-10	CEH-22
MAB-5	CEH-26
PAX-1	CES-1
LIM-6	DVE-1
RNT-1	DMD-4

UNC-3	

Waiting for library/sequencing (3)

Deletion strain available

UNC-86
TTX-3
LIN-11

Waiting for IP/Growth (4)

Deletion strain available

SOX-4
CEH-9
Y22D7AL.16
GMEB-2

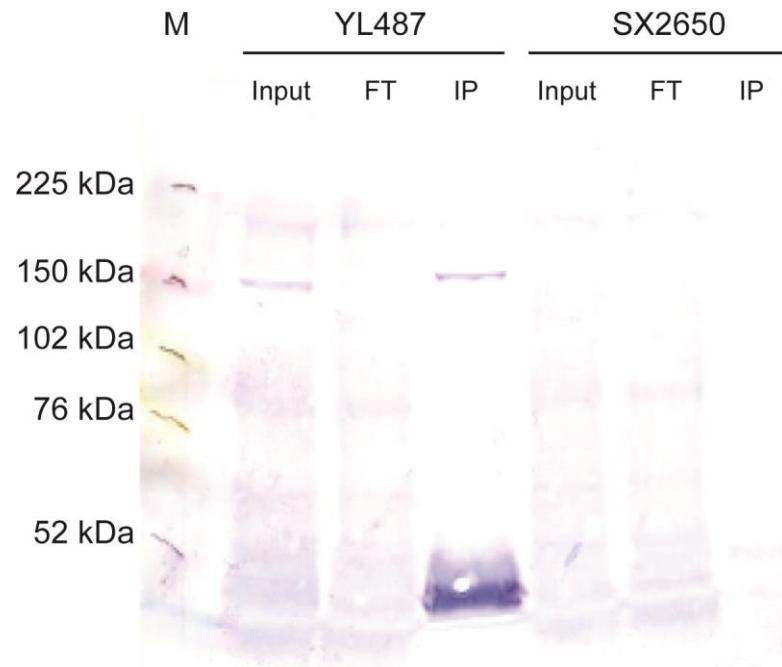

DCC issues for discussion

- DCC wants us to comply with the current quality standards of ENCODE
 - library complexity
 - IDR
 - Read depth
- These standards can't be used with worm and fly due to smaller genome size
- We are working to adapt these standards to our model systems

Antibody compliance is complete in worm for GoatV

Snyder lab performed an IP-mass spec using GoatV Ab which serves as a primary characterization

We performed an IP with GoatV Ab and then blotted with FLAG Ab

ChIP assays were conducted as previously described (Zhong et al., 2010). Young adults were collected from YL487 (snpc-4(tm4568) I; unc-119(ed3) III; wgl179 [snpc-4:TY1 EGFP 3XFLAG; unc-119]) and SX2650 (mjSi74(pmex-5::mCherry::PRDE-1_STOP::par-5 3'UTR)I) strains. The blot specifically recognizes a single species of the expected size of SNPC-4 of 143 kDa. As expected, no band is detected in the IP for SX2650.

Antibody compliance is in progress for Hyman GFP Ab

- Hyman antibody from old ModENCODE was used for several factors
- In order for these datasets to count towards the new ModERN project the Hyman Ab needs to comply with the new Ab standards
- Trying to seek exemption from these standards by providing two independent ChIP-seq comparisons
 1. EFL-1 native Ab compared to tagged EFL-1 Kudron et.al 2013
 2. ChIPseq data for SNPC-4 comparing GoatV and Hyman Abs

Update on RNA-seq

- Backcrossed deletion mutants
- Deletion strains waiting for backcross
- RNA isolated for sequencing
- RNA isolation in progress and backcrossed strains waiting for RNA isolation

4X Backcrossed mutant strains with VC2010

Gene Name	Deletion Strains	Strains Available	GFP Strains	Embryo Chip	Backcross
