Chromatin features near TAD boundaries at various resolution

H3K20me1

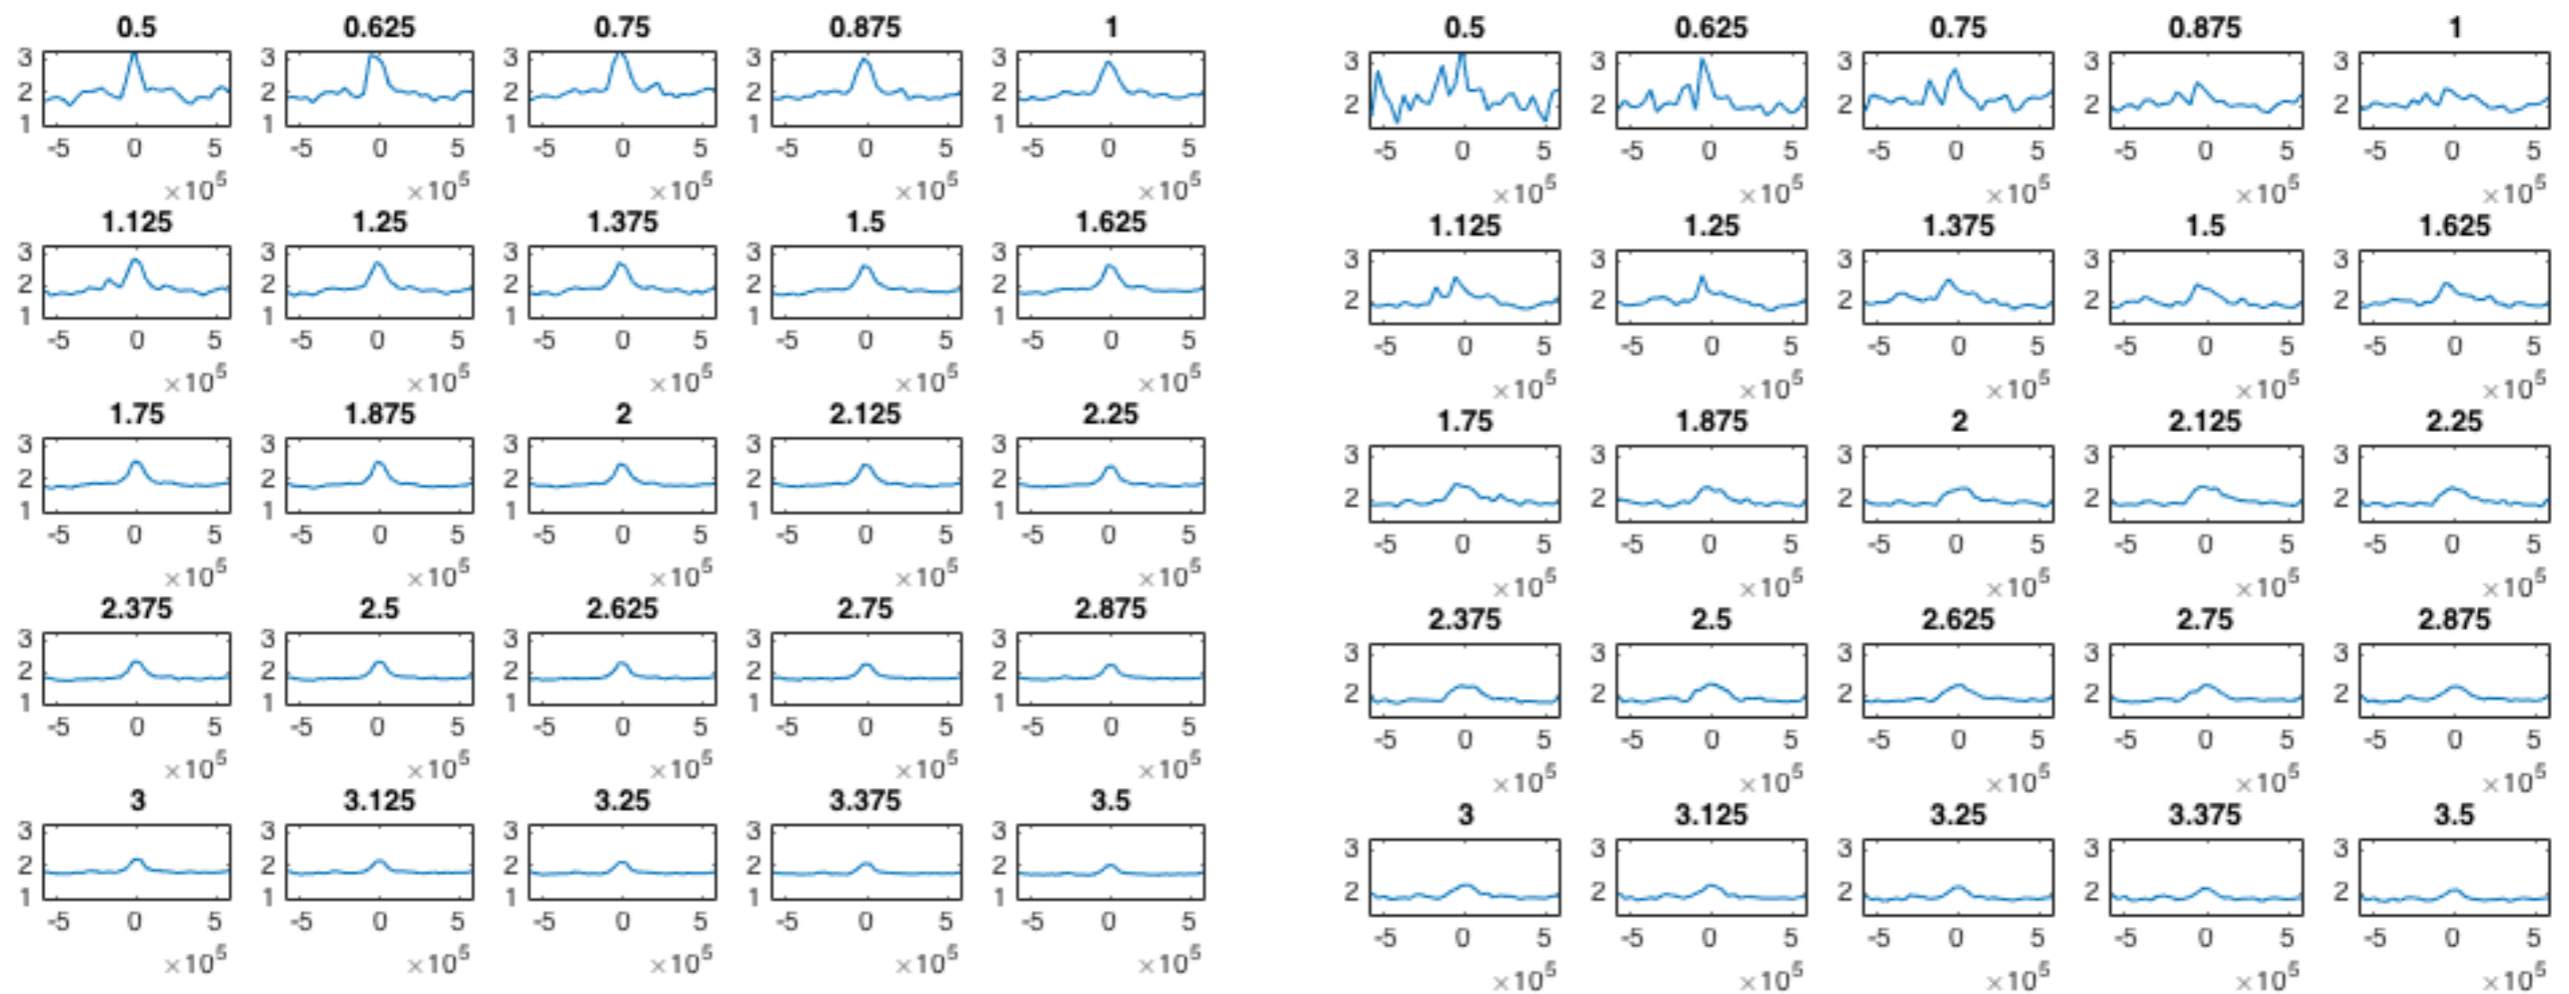

Chromatin features near TAD boundaries at various resolution

H3K4me3

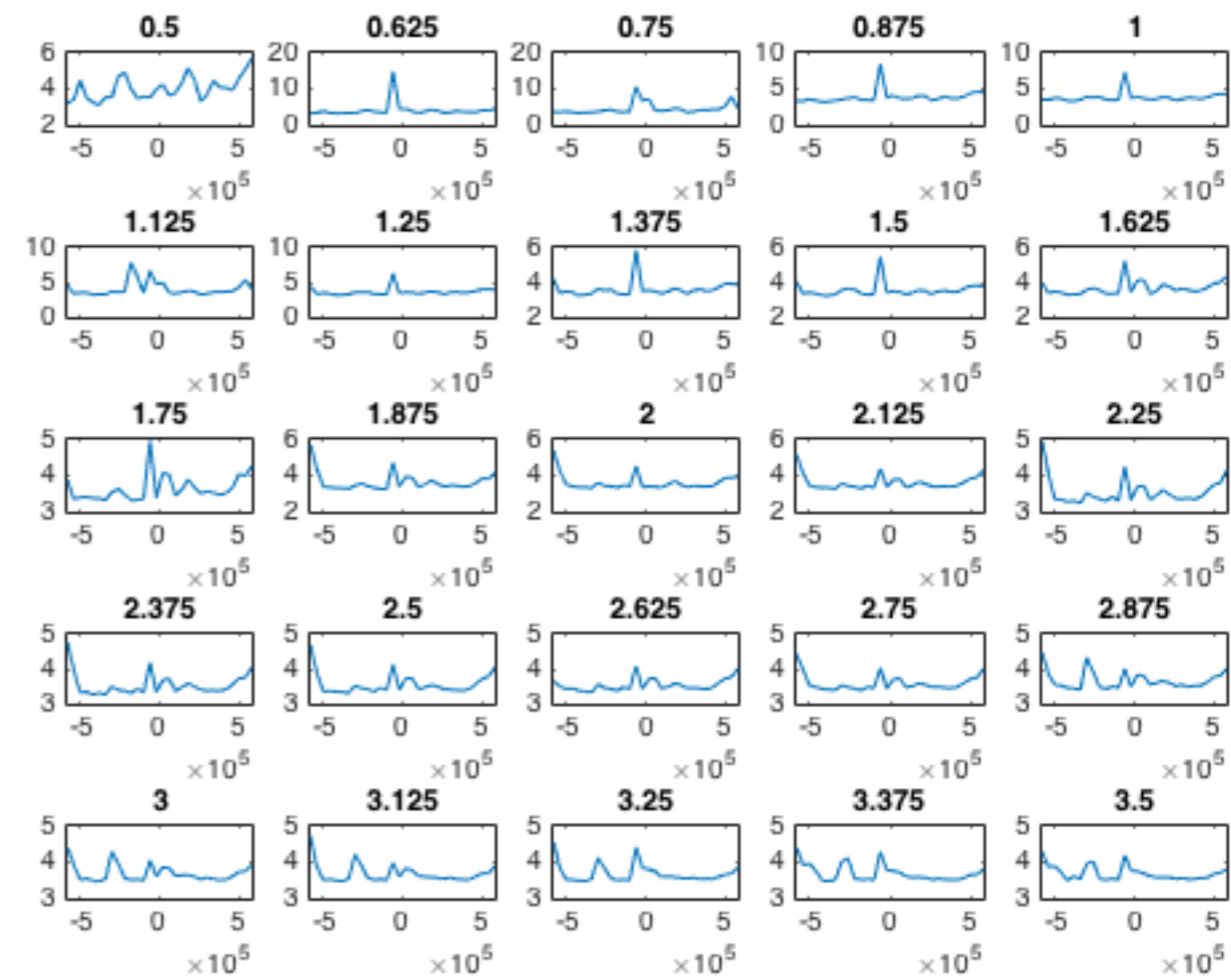

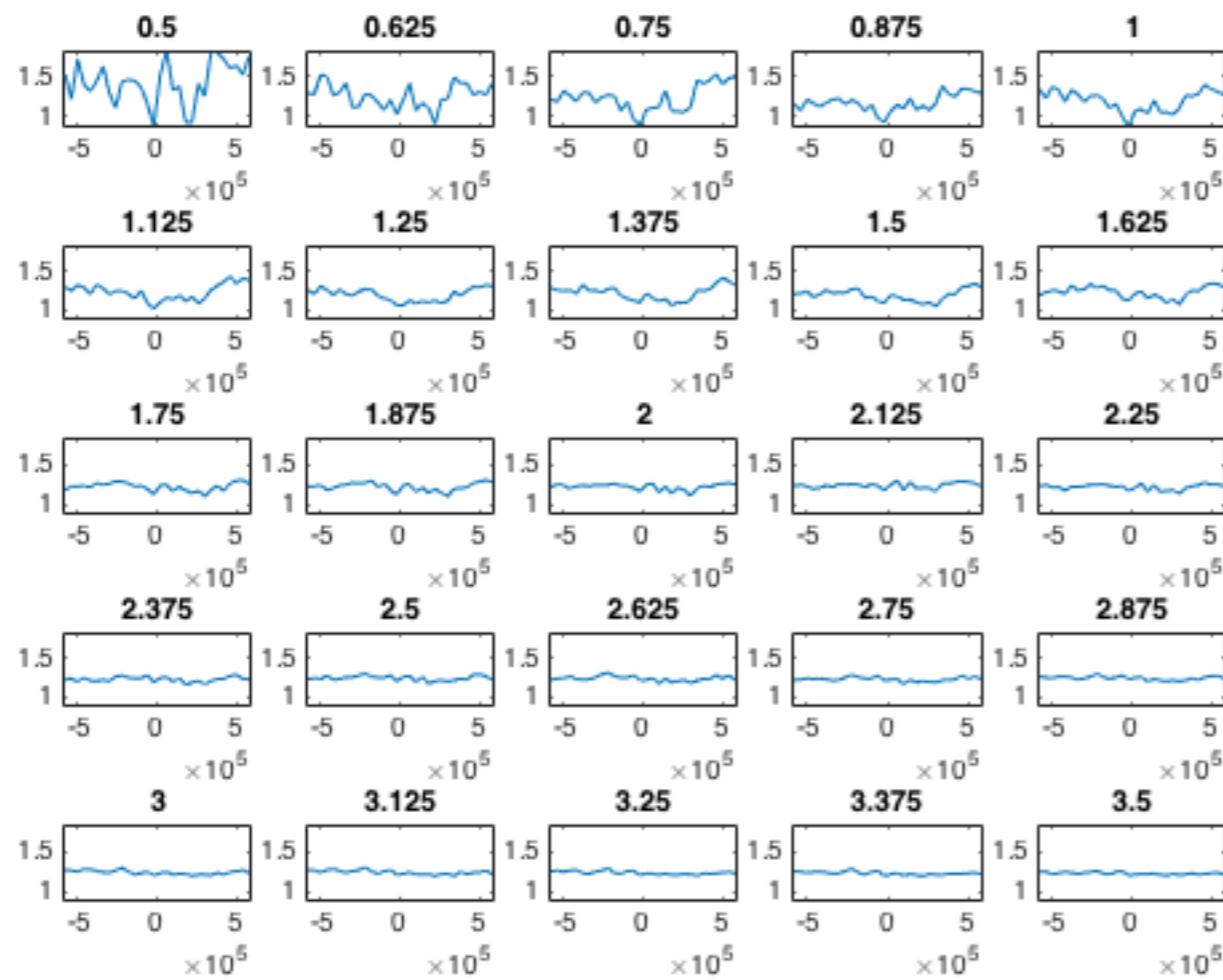

Chromatin features near TAD boundaries at various resolution

H3K79me2

Chromatin features near TAD boundaries at various resolution

H3K9me3

Chromatin features near TAD boundaries at various resolution

Using chromatin features to predict boundaries at various resolutions

pos: boundaries detected by MrTADFinder
neg: random boundaries of shuffled TADs

Chromatin features affect the formation of TADs in various resolution. How?

- Combining histone marks do well. It's hard to interpret the importance scores reported by random forest.
- Same issue for TFs. There are a few well known components of cohesin. Anything else? the importance of each TF, and their combinatorial effects.

Significant contacts

Fit-HiC

ENCODE 3 data

Correlation of boundary scores (resolution=1) between 24 ENCODE Hi-C experiments (include replicates).
