

## Transcription regulation (in *YEAST*): a genomic network

**Nicholas Luscombe**

Laboratory of **Mark Gerstein**  
Department of Molecular Biophysics  
and Biochemistry  
Yale University

**Gerstein lab:** Haiyuan Yu  
**Teichmann lab:** Madan Babu

## Comprehensive regulatory dataset in *YEAST*

	Dataset	Authors	URL	# of genes	# of regulations
Manual collection	TRANSFAC	Wingender, E., et al. 2001	<a href="http://transfac.gbf.de/TRANSFAC/">http://transfac.gbf.de/TRANSFAC/</a>	288	356
	Kepes' dataset	Guelzim, N., et al. 2002	<a href="http://www.nature.com/ng/journal/v31/n1/suppl/ng873_S1.html">http://www.nature.com/ng/journal/v31/n1/suppl/ng873_S1.html</a>	477	906
ChIP-chip experiments	ChIP-chip data by Snyder's lab	Horak, C. E., et al. 2002	<a href="http://array.mbb.yale.edu/yeast/transcription/download.html">http://array.mbb.yale.edu/yeast/transcription/download.html</a>	1560	2124
	ChIP-chip data by Young's lab	Lee, T. L., et al. 2002	<a href="http://web.mit.edu/young/regulator_network/">http://web.mit.edu/young/regulator_network/</a>	2416	4358

142 transcription factors  
3,420 target genes  
7,074 regulatory interactions

[Yu, Luscombe et al (2003), *Trends Genet*, 19: 422]

Networks provide a universal  
language to describe  
disparate systems

Protein interactions

Hierarchies & DAGs

Social interactions

## Comprehensive Yeast TF network

- Very complex network
- But we can simplify with standard graph-theoretic statistics:
  - Global topological measures
  - Local network motifs

[Barabasi, Alon]

### 1. Global topological measures

Indicate the gross topological structure of the network

Degree

Path length

Clustering coefficient

[Barabasi]

### 1. Global topological measures

Number of incoming and outgoing connections

Degree

Incoming degree = 2.1  
→ each gene is regulated by ~2 TFs

Outgoing degree = 49.8  
→ each TF targets ~50 genes

[Barabasi]

## Scale-free distribution of outgoing degree

- Most TFs have few target genes
- Few TFs have many target genes

[Barabasi]

## 1. Global topological measures

Number of intermediate TFs until final target

[Barabasi]

## 1. Global topological measures

Ratio of existing links to maximum number of links for neighbouring nodes

Measure how inter-connected the network is

**Average coefficient = 0.11**

[Barabasi]

## 2. Local network motifs

Regulatory modules within the network

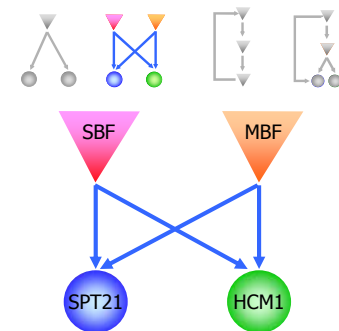

[Alon]

SIM = Single input motifs

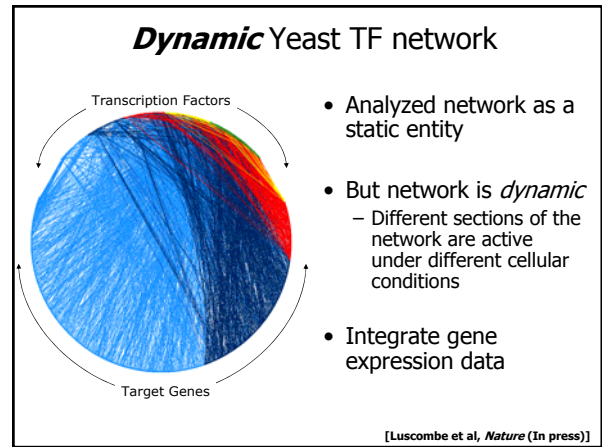

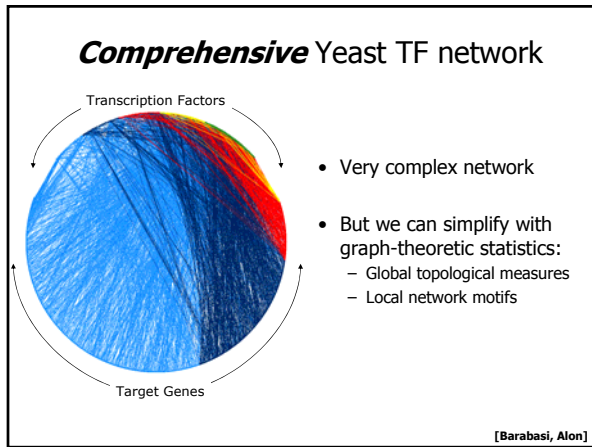

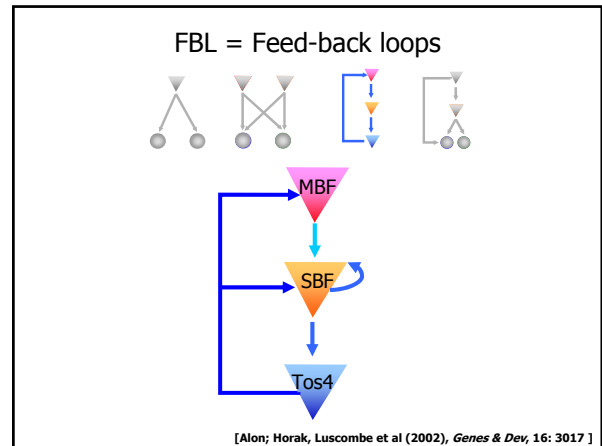

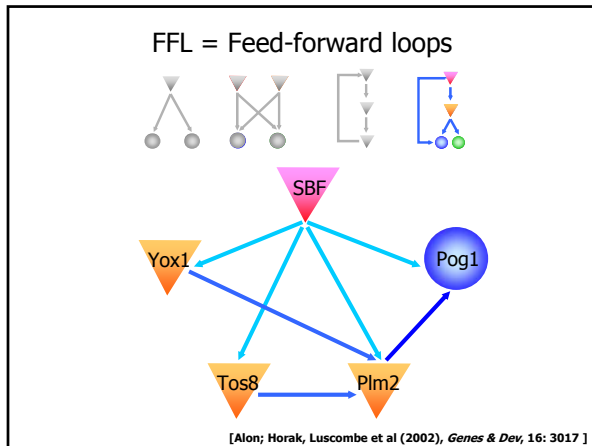

[Alon; Horak, Luscombe et al (2002), *Genes & Dev*, 16: 3017]

MIM = Multiple input motifs

[Alon; Horak, Luscombe et al (2002), *Genes & Dev*, 16: 3017]

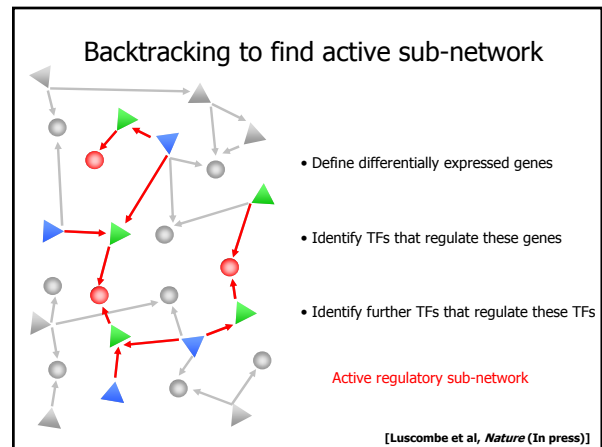

Gene expression data

- Genes that are differentially expressed under five cellular conditions

Cellular condition	No. genes
Cell cycle	437
Sporulation	876
Diauxic shift	1,876
DNA damage	1,715
Stress response	1,385

- Assume these genes undergo transcription regulation

[Luscombe et al, *Nature* (In press)]

Network usage under different conditions

**static**

[Luscombe et al, *Nature* (In press)]

Network usage under different conditions

**cell cycle**

[Luscombe et al, *Nature* (In press)]

Network usage under different conditions

**sporulation**

[Luscombe et al, *Nature* (In press)]

Network usage under different conditions

**diauxic shift**

[Luscombe et al, *Nature* (In press)]

Network usage under different conditions

**DNA damage**

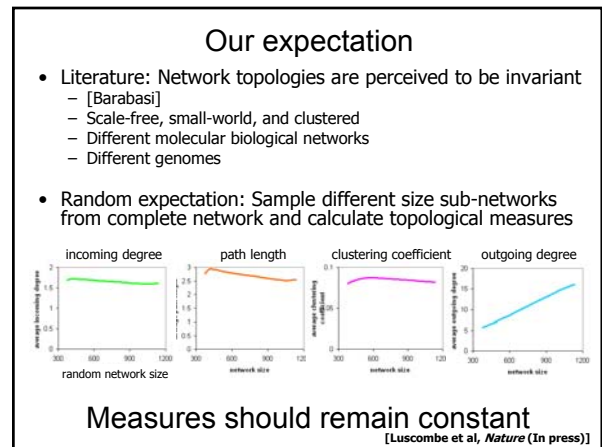

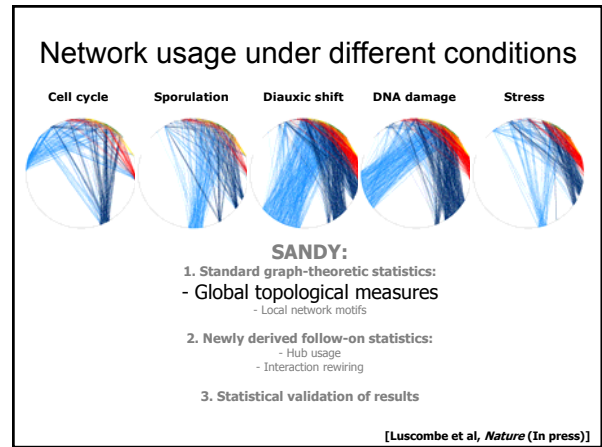

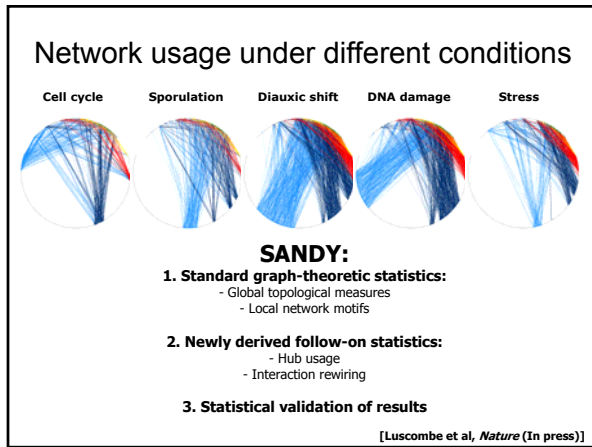

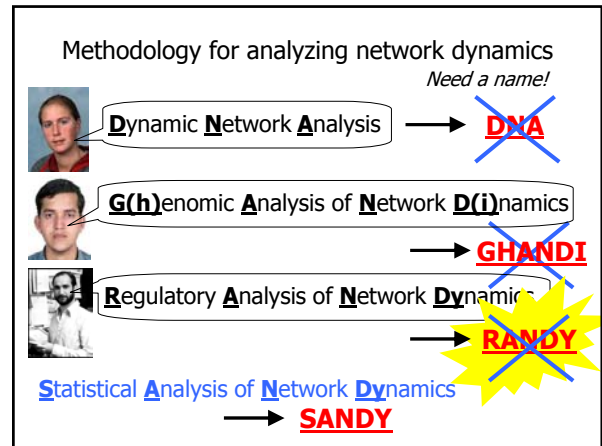

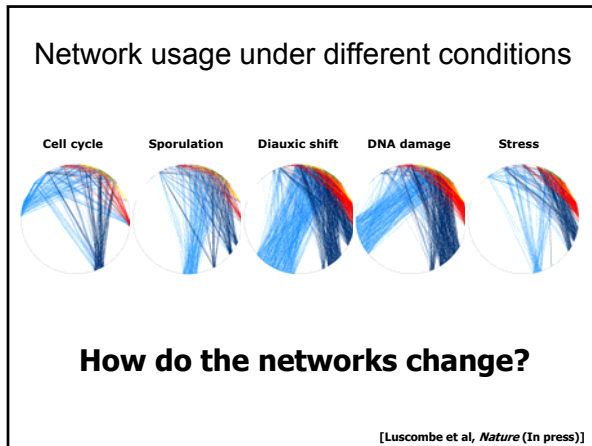

[Luscombe et al, *Nature* (In press)]

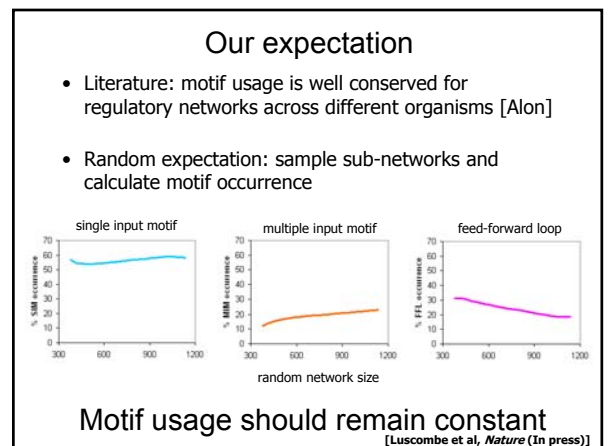

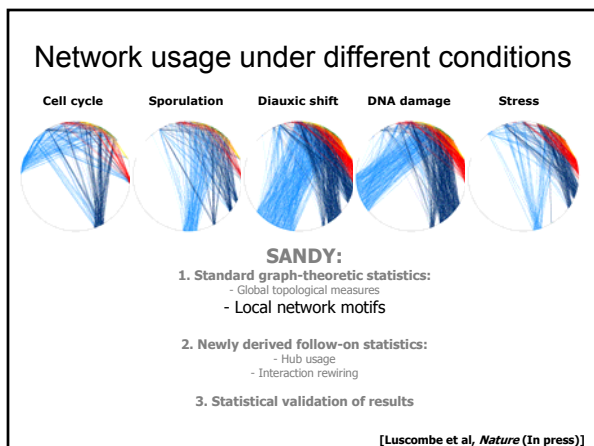

Network usage under different conditions

**stress response**

[Luscombe et al, *Nature* (In press)]

### 1. Standard statistics – local network motifs

Motifs		Cell cycle	Sporulation	Diauxic shift	DNA damage	Stress response
<b>SIM</b>		32.0%	38.9%	57.4%	55.7%	59.1%
<b>MIM</b>		23.7%	16.6%	23.6%	27.3%	20.2%
<b>FFL</b>		44.3%	44.5%	19.0%	17.0%	20.7%

[Luscombe et al, *Nature* (In press)]

### 1. Standard statistics - summary

multi-stage conditions

binary conditions

- fewer target genes
- longer path lengths
- more inter-regulation between TFs

- more target genes
- shorter path lengths
- less inter-regulation between TFs

[Luscombe et al, *Nature* (In press)]

### Network usage under different conditions

#### SANDY:

1. Standard graph-theoretic statistics:
  - Global topological measures
  - Local network motifs
2. Newly derived follow-on statistics:
  - Hub usage
  - Interaction rewiring
3. Statistical validation of results

[Luscombe et al, *Nature* (In press)]

### 1. Follow-on statistics – network hubs

Regulatory hubs  
>100 target genes

Dictate structure of network

- Most TFs have few target genes
- Few TFs have many target genes

[Barabasi]

### **An aside:** Essentiality of regulatory hubs

- Hubs dictate the overall structure of the network
- Represent vulnerable points
- **How important are hubs for viability?**
- Integrate gene essentiality data

[Yu et al (2004), *Trends Genet*, 20: 227

### **Essentiality** of regulatory hubs

- Essential genes are *lethal* if deleted from genome
  - 1,105 yeast genes are essential
- Which TFs are essential?

**Hubs tend to be more essential than non-hubs**

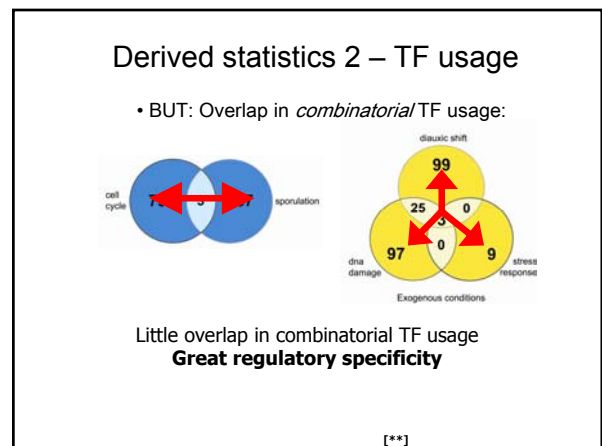

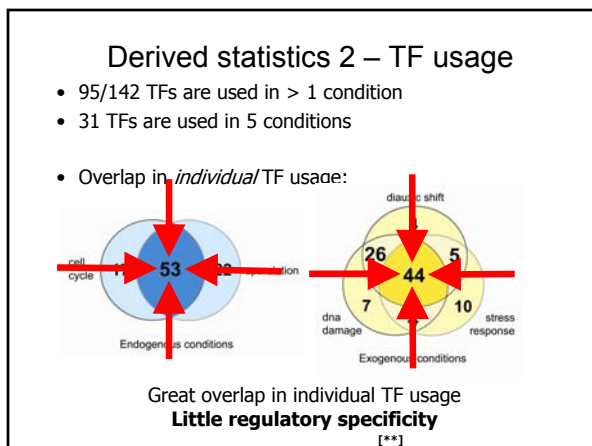

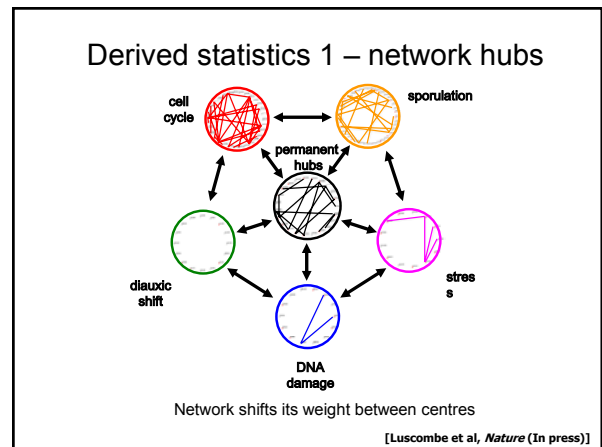

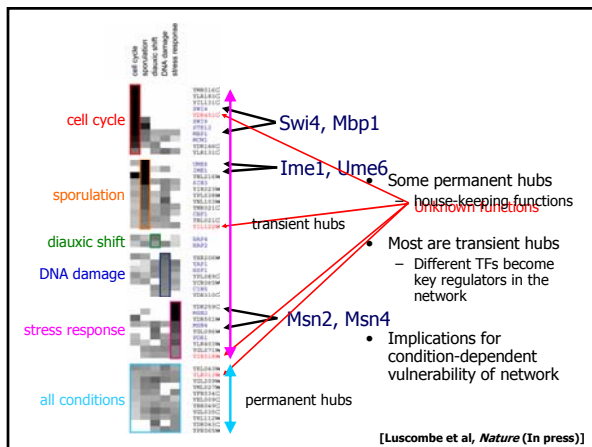

[Yu et al (2004), *Trends Genet*, 20: 227

### Our expectation

- Literature:
  - Hubs are permanent features of the network regardless of condition
- Random expectation: sample sub-networks from complete regulatory network
  - Random networks converge on same TFs
  - 76-97% overlap in TFs classified as hubs
  - ie* hubs are permanent

[Luscombe et al, *Nature* (In press)]

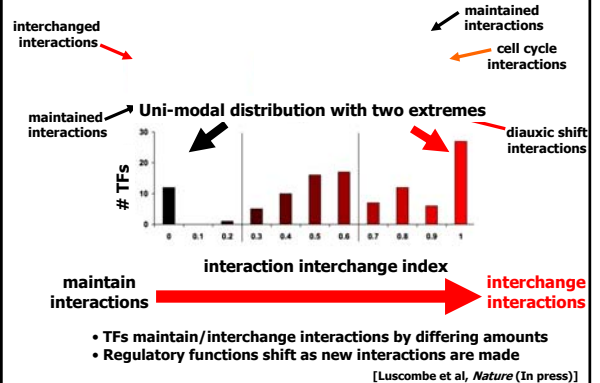

## 2. Follow-on statistics – interaction interchange

- Network undergoes substantial rewiring between conditions
- TFs must be replacing interactions with new ones between conditions
- Interchange Index = proportion of interactions that are maintained between conditions

[Luscombe et al, *Nature* (In press)]

## 2. Follow-on statistics – interaction interchange

## Regulatory circuitry of cell cycle time-course

- Multi-stage conditions have:
  - longer path lengths
  - more inter-regulation between TFs
- How do these properties actually look?
  - examine TF inter-regulation during the cell cycle

[Luscombe et al, *Nature* (In press)]

## Regulatory circuitry of cell cycle time-course

Phase-specific TFs show **serial** inter-regulation  
→ drive cell cycle forward through time-course

[Luscombe et al, *Nature* (In press)]

## Regulatory circuitry of cell cycle time-course

### 2. parallel inter-regulation

Ubiquitous and phase-specific TFs show **parallel** inter-regulation

Many ubiquitous TFs are permanent **hubs**

→ Channel of communication between house-keeping functions and cell cycle progression

[Luscombe et al, *Nature* (In press)]

## Network dynamics in FANTOM 3?

- SANDY framework is generally applicable to many types of networks
- Example applications:
  - Tissue-specific regulatory sub-networks
  - Sub-network time-courses during development
  - Conservation of networks and sub-networks in mouse and human
  - Prediction of TF hubs
  - Human disease loci, and vulnerability of network (eg hubs and lethality)
  - Integrated molecular network (protein-protein, protein-DNA, RNA-RNA etc)
- Current challenges:
  - How do we get to a network using current data?
  - Networks are obviously more complex than in yeast eg alternative TSS

*"They say they built the train tracks over the Alps between Vienna and Venice before there was a train that could make the trip.*

*They built it anyway.*

*They knew one day a train would come."*

Movie - Under the Tuscan Sun

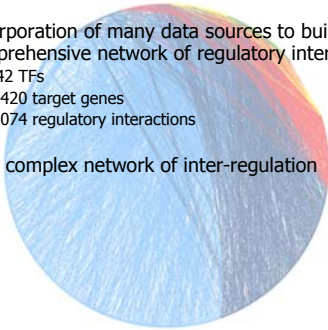

**Mark Gerstein**  
Haiyuan Yu

Madan Babu

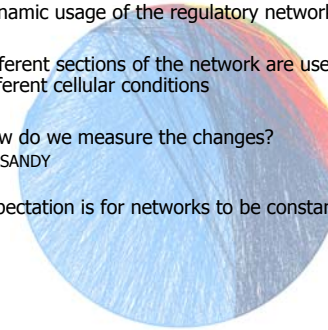

### Summary 1

- Incorporation of many data sources to build a comprehensive network of regulatory interactions
  - 142 TFs
  - 3,420 target genes
  - 7,074 regulatory interactions
- Very complex network of inter-regulation

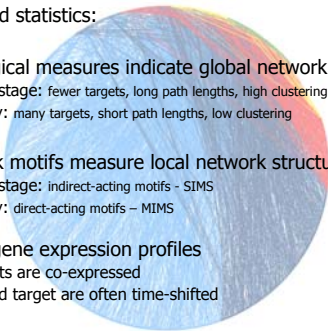

### Summary 2

- Dynamic usage of the regulatory network
- Different sections of the network are used in different cellular conditions
- How do we measure the changes?
  - SANDY
- Expectation is for networks to be constant

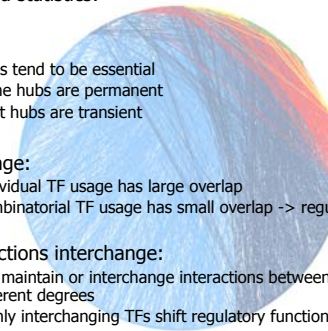

### Summary 3

- Standard statistics:
- Topological measures indicate global network structure
  - Multi-stage: fewer targets, long path lengths, high clustering
  - Binary: many targets, short path lengths, low clustering
- Network motifs measure local network structure
  - Multi-stage: indirect-acting motifs - SIMS
  - Binary: direct-acting motifs - MIMS
- *Aside:* gene expression profiles
  - Targets are co-expressed
  - TF and target are often time-shifted

### Summary 4

- Derived statistics:
- Hubs:
  - Hubs tend to be essential
  - Some hubs are permanent
  - Most hubs are transient
- TF usage:
  - Individual TF usage has large overlap
  - Combinatorial TF usage has small overlap -> regulatory specificity
- Interactions interchange:
  - TFs maintain or interchange interactions between conditions to different degrees
  - Highly interchanging TFs shift regulatory functions

### Summary 5

- Multi-stage conditions have:
  - Much inter-regulation and long path lengths
- Examine regulatory time-course of cell cycle
  - Serial inter-regulation between phase-specific TFs drive cell cycle
  - Parallel inter-regulation between ubiquitous and phase-specific TFs allow communication between cell cycle and house-keeping functions

### Summary 6

- Data integration
- Bayesian methods to uniformly & optimally combine evidence (in application to integration of protein interaction data)
- Predicting interactions in yeast de novo from non-interaction data sources (with verification)
